Current State

Working Capital Portfolio Monitoring Dashboard

Prepared By	Business Analyst
Version	1.0
Date	June 2025

1. Current Process Overview

The current Working Capital monitoring process for OD and CC accounts is largely manual and dependent on multiple disconnected systems — Flexcube (Core Banking), LaserSoft, and Early Warning Systems (EWS).

Relationship Managers, Credit Teams, and Portfolio Managers access these systems separately to monitor customer accounts, credit utilization, overdue positions, stock statement status, and compliance documents.

There is no centralized dashboard or consolidated view. All monitoring is done account by account, requiring significant manual effort to identify risk indicators across the portfolio.

2. Actors Involved in the Current Process

Actor	System Used	Activity
Relationship Manager	Flexcube, EWS	Account-level utilization and conduct review
Credit Team	EWS, LaserSoft	SMA/NPA tracking, overdue review, document status
Portfolio Manager	Excel, Multiple Systems	Manual MIS consolidation and portfolio review
Operations Team	LaserSoft, Excel	Stock statement and deferral document tracking
Branch Manager	Excel Reports	Branch-level portfolio summary review

3. Current Monitoring Process — Step by Step

Step	Actor	Activity	System Used
1	RM / Credit Team	Log into EWS to check customer risk status and early warning indicators	EWS
2	RM / Credit Team	Search customer accounts individually and review overdue status, repayment behavior, and account conduct	EWS
3	RM / Credit Team	Log into Flexcube separately to check sanctioned limit, drawing power, and utilization	Flexcube
4	RM / Credit Team	Identify high-utilization and low-utilization accounts manually	Flexcube
5	Credit Team	Log into LaserSoft to check collateral details, pending documents, and deferral status	LaserSoft
6	Operations Team	Manually track pending stock statements, renewal due dates, and deferral documents	LaserSoft / Excel
7	Portfolio Manager	Consolidate data from EWS, Flexcube, and LaserSoft into Excel spreadsheets	Excel
8	Portfolio Manager	Prepare manual MIS reports — utilization summary, overdue list, SMA accounts	Excel
9	Credit Team	Review MIS reports and escalate high-risk accounts to senior management	Email / Manual
10	Senior Management	Review escalated accounts and take monitoring decisions	Email / Reports

4. Current State Challenges

- Data is spread across multiple disconnected systems — Flexcube, LaserSoft, and EWS
- No centralized portfolio view — users monitor accounts individually, not at portfolio level
- Heavy dependence on manual Excel-based MIS preparation and consolidation
- SMA and NPA identification is delayed due to manual validation across systems

- Stock statement submissions, deferral documents, and renewals tracked manually with no automated alerts
- Account churning and interest servicing are not monitored systematically
- Monitoring practices and report formats vary across Relationship Managers and branches
- No industry-wise, product-wise, or segment-wise portfolio visibility
- Escalation of high-risk accounts depends on manual review rather than automated triggers

5. Key Pain Points

Pain Point	Business Impact
Manual data consolidation across systems	High operational effort — significant time spent on MIS preparation instead of customer engagement
No centralized portfolio dashboard	Limited portfolio-level visibility — no product-wise, industry-wise, or segment-wise view
Delayed SMA and NPA identification	Increased risk of accounts slipping into NPA without timely intervention
Manual stock statement and deferral tracking	Compliance gaps — missed submissions may not be identified until audit or review
Account churning not monitored	Low-activity accounts not flagged proactively — potential early warning signal missed
Spreadsheet dependency	Higher risk of data errors, inconsistent formats, and version control issues
No automated utilization alerts	High-utilization and low-utilization accounts not flagged in real time
Inconsistent monitoring across teams	Different RMs and branches follow different monitoring practices — no standardized approach

6. Business Impact of Current Process

The current manual monitoring approach results in:

- Delayed identification of stressed accounts — SMA slippage risk increases without timely visibility
- Increased operational workload for Credit Teams and Portfolio Managers
- Reduced portfolio monitoring efficiency — time spent on data gathering rather than analysis
- Limited visibility into portfolio trends, industry concentration, and segment-level exposure
- Inconsistent credit monitoring across branches and Relationship Managers
- Higher exposure to delinquency risk due to delayed escalation

7. Current State Summary

The existing Working Capital OD/CC portfolio monitoring process is manual, fragmented, and operationally inefficient. Users access multiple systems — Flexcube, LaserSoft, and EWS — independently, consolidate data manually into Excel, and prepare MIS reports without any centralized dashboard.

The absence of a consolidated portfolio view, automated KPI tracking, and real-time compliance monitoring creates significant operational and risk-related challenges for credit teams and portfolio managers.

These pain points directly justify the need for the Working Capital Portfolio Monitoring Dashboard — a centralized SQL Server-backed Power BI solution that provides portfolio-level KPI visibility, automated compliance tracking, and real-time monitoring across all OD/CC accounts.
