

GAP ANALYSIS DOCUMENT

Working Capital Portfolio Monitoring Dashboard

Prepared By	Business Analyst
Version	1.0
Date	June 2025

1. Introduction

This GAP Analysis identifies the difference between the current monitoring process (AS-IS) and the proposed future-state solution (TO-BE) for Working Capital OD/CC portfolio monitoring.

The analysis helps identify:

- Current operational challenges and monitoring limitations
- Process inefficiencies and manual effort areas
- Gaps in portfolio visibility, compliance tracking, and KPI reporting
- Opportunities addressed by the Working Capital Portfolio Monitoring Dashboard

2. Current State (AS-IS) Summary

The current monitoring process depends on:

- Multiple disconnected systems — Flexcube, LaserSoft, and EWS
- Manual data extraction and Excel-based consolidation
- Account-by-account review with no portfolio-level view

Key limitations:

- No centralized dashboard or portfolio view
- SMA and NPA accounts identified manually with delays
- Stock statements, deferrals, and renewals tracked in spreadsheets
- No utilization monitoring at portfolio level
- No industry-wise, product-wise, or segment-wise analysis
- Inconsistent monitoring practices across Relationship Managers and branches

3. Future State (TO-BE) Summary

The Working Capital Portfolio Monitoring Dashboard addresses all identified gaps through:

- A structured SQL Server database consolidating data from Flexcube, LaserSoft, and EWS
- A five-page Power BI dashboard covering Portfolio Overview, RM Workbench, Risk & Compliance, Portfolio Analytics, and Data Export
- Automated KPI tracking for utilization, SMA/NPA, compliance, and portfolio concentration
- Daily data refresh providing near real-time portfolio visibility

4. GAP Analysis Table

AS-IS (Current State) highlighted in red | TO-BE (Future State) highlighted in green

Area	Current State (AS-IS)	Future State (TO-BE)	Dashboard Implementation
Portfolio Visibility	No centralized view — account-by-account review across multiple systems	Single consolidated Power BI dashboard with full portfolio view	Page 1 — Portfolio Overview: Total Customers, Sanctioned Amount, Utilized Amount, Utilization %
SMA / NPA Monitoring	Manual identification — delayed due to cross-system validation	Automated SMA and NPA account count with daily refresh	Page 1 — Portfolio Overview: Total SMA Accounts, Total NPA Accounts
Credit Utilization Monitoring	Manual identification of high and low utilization accounts	Automated tracking of high and low utilization accounts	Page 3 — Risk & Compliance: High Utilization Accounts, Low Utilization Accounts
Stock Statement Tracking	Manual tracking in Excel — missed submissions not flagged proactively	Centralized tracking of all pending stock statement accounts	Page 3 — Risk & Compliance: Pending Stock Statements
Deferral Document Tracking	Manual follow-up — no consolidated deferral status view	All deferral accounts visible in a single compliance view	Page 3 — Risk & Compliance: Deferral Accounts
Account Churning Monitoring	Not monitored systematically — low-activity accounts not flagged	Non-churning accounts identified and tracked automatically	Page 3 — Risk & Compliance: Non-Churning Accounts
Product-wise Analysis	No product-level portfolio breakdown available	Product-wise sanctioned amount distribution available	Page 4 — Portfolio Analytics: Product-wise Sanctioned Amount
Industry Concentration	No industry-level visibility — concentration risk not tracked	Industry-wise portfolio concentration analysis available	Page 4 — Portfolio Analytics: Industry-wise Concentration
Segment-wise Analysis	No segment-level portfolio breakdown available	Segment-wise sanctioned amount distribution available	Page 4 — Portfolio Analytics: Segment-wise Sanctioned Amount
RM-wise Portfolio View	No RM-level portfolio tracking — no accountability view	RM-wise portfolio distribution available for performance review	Page 4 — Portfolio Analytics: RM-wise Portfolio Distribution
Data Source Integration	Manual extraction from Flexcube, LaserSoft, EWS separately	All source systems integrated into SQL Server database	SQL Server — 13 source tables including Customer Master, Loan Account, Utilization Daily, Overdue Status, Stock Statement, and others
Reporting Effort	Heavy manual MIS preparation — significant time on data consolidation	Automated daily refresh — reports available without manual effort	Power BI daily refresh replaces manual MIS preparation
Monitoring Consistency	Varies across RMs and branches — no standardized KPI framework	Standardized KPI definitions applied consistently across portfolio	Uniform KPI logic defined in SQL and applied across all dashboard pages
Renewal & Interest Servicing Tracking	Manual tracking of renewal due dates and interest servicing status in spreadsheets — no RM-level action list	Renewal pipeline and interest servicing status tracked per RM with automated bucketing	Page 2 — RM Workbench: Renewal Pipeline by Bucket, Renewal Action List, Interest Servicing – Payment Status
Account-Level Data Export	No consolidated, exportable account-level extract — users rebuild extracts manually in Excel	Single exportable detail table covering all accounts for filtering and download	Page 5 — Data Export: Portfolio Detail – Full Account Extract

5. Key Gaps Identified

Gap	Priority
No centralized portfolio dashboard	High
Manual SMA and NPA identification — delayed response	High
No automated compliance tracking for stock statements and deferrals	High
No industry-wise or product-wise concentration analysis	High
Account churning not monitored	Medium
No RM-wise portfolio accountability view	Medium
Heavy manual MIS preparation effort	Medium
Inconsistent monitoring practices across teams	Medium

6. Business Impact of Current Gaps

The current process results in:

- Delayed SMA identification — increased risk of NPA slippage without proactive intervention
- Compliance exposure — missed stock statements and deferral documents not flagged
- No concentration risk visibility — industry or product-level over-exposure not tracked
- High operational workload — credit teams spend time on data preparation instead of analysis
- Inconsistent monitoring — no standardized KPI framework across branches and RMs

7. Recommendations

Based on the GAP analysis, the following have been implemented in the final solution:

- Centralized SQL Server database integrating all source system data
- Power BI Portfolio Overview dashboard (Page 1) for total portfolio KPIs
- Power BI RM Workbench dashboard (Page 2) for renewal pipeline and interest servicing follow-up
- Power BI Risk & Compliance dashboard (Page 3) for utilization, compliance, and churning monitoring
- Power BI Portfolio Analytics dashboard (Page 4) for product, industry, segment, and RM-wise analysis
- Power BI Data Export page (Page 5) for a consolidated, filterable account-level extract
- Standardized KPI definitions applied consistently across all monitoring dimensions
- Daily data refresh replacing manual MIS preparation

8. Conclusion

The GAP Analysis clearly establishes the limitations of the current manual monitoring process and validates the need for the Working Capital Portfolio Monitoring Dashboard.

The implemented solution directly addresses each identified gap — from SMA monitoring and compliance tracking to industry concentration and RM-wise portfolio analysis — through a structured SQL Server data model and a five-page Power BI dashboard.

The transition from manual, fragmented monitoring to centralized, KPI-driven dashboard reporting improves portfolio visibility, reduces operational effort, and supports proactive decision-making for credit and business teams.
